1	Intelligent insecticide and fertilizer recommendation system based on TPF-CNN for smart farming	TanmayThorat	2023	<p>The proposed system combines two major aspects in farming: pest identification and insecticide recommendation using machine vision and <u>CNN</u>. Secondly, the soil nutrient analysis uses a soil NPK sensor with the recommendation of fertilizers according to the obtained nutrient values.</p> <p>This work utilizes an open dataset of 5000 pictures of unhealthy and solid plants, where convolution system and semi supervised techniques are used to characterize crop species and detect the sickness status of 4 distinct classes.</p> <p>This methodology requires experts who can recognize varieties in leaf shading. Ordinarily a similar malady is characterized by a few specialists as a different sickness. Recruiting qualified ranchers can't be reasonable especially in far off geologically detached zones.</p> <p>Methodology, the user will upload the soil test report into the system for soil analysis. soil analysis will be carried out by the sensors. Sensors measure the nutrients level of the soil and the data was stored within the database Next corresponding crops infection status will be analyzed and recorded. Then comparison and classification of the soil</p>
